

# A Systematic Literature Review on Role-Based Access Control

---

## Abstract

Role-based access control (RBAC) has become an increasingly popular access control for various applications such as web applications and database applications. RBAC restricts access to resources based on identity of subjects and/or groups called roles. Since RBAC is introduced in 1998, researchers have proposed various extended models of RBAC. For example, they define additional constraints among roles (e.g., temporal constraints or location constraints) or hierarchy relationship of roles. Our goal of this work is to study extended models of RBAC and analyze their extended features and claimed research contributions to find limitations of current RBAC models and what extent of extended features that can be used for future RBAC. We conduct a systematic literature review by collecting and synthesizing relevant research papers. We initially collect XXXX papers from various sources such as IEEE and ACM websites and selected 26 papers systemically. We perform a comparative analysis to find relationships among extended models and RBAC.

## 1. Introduction

Why is the base model of RBAC extended by newer models?

Role-based access control (RBAC) models [1] become popularly used to govern access to critical resources. In an RBAC model, roles represent a group of users who are involved in a specific job function in an organization. RBAC assigns permissions of specific actions on resources to roles instead of individual users. Therefore, in order to gain roles' permission on specific resources, users acquire appropriate roles first.

RBAC is a generalized access control approach used for various applications including web services, database applications, and healthcare applications. RBAC has advantages in maintaining and managing organization's

security policies. For example, if a user is to access manager role’s resources within a given organization, security policy administrators simply add the user to be associated with the manager role.

RBAC is first introduced in 1990s, NIST proposed standard RBAC model [1] Standard RBAC model considers only role-user association and role hierarchy. Since standard RBAC model has limitations such as specifying environmental constraints or context information Researchers developed extended models of RBAC to overcome the limitations. However, as researchers often develop their own specialized extended models of RBAC, their research cannot be generalized or compared with other research work appropriately. As a result, researchers could take time on reinventing the wheel. But how do we, as a community, ensure that a metric is suitable and acceptable for its intended purpose?

The goal of this work is to synthesize available research results on extended models of RBAC. We analyze their extended features and claimed research contributions to find limitations of current RBAC models and what extent of extended features by comparing with similar research work. We conducted a systematic literature review (SLR) to evaluate and interpret all available research relevant to a particular research question or topic area of interest.

- Our research give benefits to a community as follows:**
- Our work summarizes current extended RBAC research work and its contributions. By synthesizing the current results, our work shows a roadmap of current extended RBAC research.
  - Our work guides a direction for a standard of extended RBAC. Understanding the categorization and the motivation of the existing research results helps decide a standard of extended RBAC.
  - Our work shows a criteria in comparison among research results.
  - Our work helps identify the research challenges in the ares of security policies and suggest a future extension of RBAC.

## 2. Methodology and Process

The systematic literature review process was developed ahead of time and agreed upon by the researchers following recommendations from Kitchenham’s suggested processes [2]. The systematic literature review was performed in four stages:

- Development of a search strategy
- Elimination of papers based on title
- Elimination of papers based on abstract
- Elimination of papers based on content and matching to elimination criteria

### *2.1. Search Strategy*

For the first phase of our systematic literature review, an automated comprehensive search of multiple academic search engines was performed. The list of search engines were:

- Google Scholar - <http://scholar.google.com>
- IEEEExplore - <http://ieeexplore.ieee.org>
- ACM Portal - <http://dl.acm.org>
- CiteSeerX - <http://http://citeseerx.ist.psu.edu/index>

For each of the criteria below, a search was performed on each of the search engines for a total of 12 data sets. The criteria used were:

- role based access control
- RBAC
- role-based access control

The search performed was done in an automated way using a set of scripts to query and collect data from each search engine with the criteria string as input. For each criteria for each search engine, the results were captured until a stopping criteria was met. Each run was performed as follows:

1. Remote call to search engine with current search start position and the current search criteria.
  2. Parse results and extract paper title, authors and year of publication.
  3. Compare results against stopping criteria.
- If stopping criteria met, stop search.

- If stopping criteria not met, increase search position by number of results and return to step 1.

The stopping criteria used was either after the first 1000 results, a limitation imposed by some of the search engines, or if ten consecutive results did not contain the search criteria phrase within the title. After gathering all 12 data sets, the data was combined into a master list by systematically comparing the bibliographic information for each. After producing a master list, a series of assessment rounds were performed to narrow the paper list and identify primary sources.

## *2.2. Elimination Rounds*

The elimination rounds were performed based on reading of the title, abstract and finally the paper itself. While each elimination stage had a unique set of criteria for elimination the general procedure for elimination for the researchers was as follows.

- Each reviewer independently classified papers as relevant, irrelevant or uncertain.
- Those papers marked as relevant by both reviewers were kept and those marked irrelevant by both were thrown out.
- Papers marked as relevant, or irrelevant by a single reviewer were combined with all papers marked as uncertain and discussed by both reviewers. From this discussion, papers were either thrown out or kept until the next round of the review. Ties were broken by an independent party.

The title elimination round was based off of whether role based access control and model were mentioned directly.

The second round of elimination was based off on reading the abstracts of the remaining papers. The inclusion criteria for the abstract reading tried to answer the following questions:

- Does the abstract mention a proposed model?
- Does the abstract mention extension of role-based access control?

- Does the abstract mention either an implementation, evaluation or domain for their model?

The results of the searches is summarised below:

Search Engines	RBAC	role based access control	role-based access control	Total
Google Scholar	651	213	435	1299
ACM Portal	500	20	720	1240
IEEEExplore	200	40	230	470
CiteSeerX	100	100	150	350
Totals	1451	373	1535	3359
Combined				<b>1716</b>

### 3. Data Extraction

After selection of primary sources, the next step was to extract data from each paper that pertained to our research questions in order to look for trends. The first step was to take the individual data generated from the final elimination round and organize this information around the research questions. During the paper reading round, and resulting data, the fact that the papers were logically falling into a number of categorizations became evident. Thus, the first step undertaken was to answer the question of what categories exist for the RBAC model extensions and what papers fall into what categories. The result of this paper categorization is displayed below:

<b>Paper</b>	<b>Category</b>
Alam, M. and Hafner, M. and Breu, R. 2006 [3]	Constraint
Tzelepi, Sofia K. and Koukopoulos, Dimitrios K. and Pangalos, George 2001 [4]	Context
Haibo, SHEN and Fan, HONG 2005 [5]	Context
Damian G. Cholewka and Reinhardt A. Botha and Jan H. P. Eloff 2000 [6]	Context
Huang, X. and Wang, H. and Chen, Z. and Lin, J. 2006 [7]	Context
Motta, G.H.M.B. and Furuie, S.S. 2003 [8]	Context
Bao, Y. and Song, J. and Wang, D. and Shen, D. and Yu, G. 2008 [9]	Context
Yamazaki, W. and Hiraishi, H. and Mizoguchi, F. 2004 [? ]	Context
Jian-min, H. and Xi-yu, L. and Hui-qun, Y. and Jun, T. 2008 [10]	Context
Thein, N. and others 2011 [11]	Context
Zou, D. and He, L. and Jin, H. and Chen, X. 2009 [12]	Context
Hasebe, K. and Mabuchi, M. and Matsushita, A. 2010 [13]	Delegation
Zhang, Z. and Zhang, X. and Sandhu, R. 2006 [14]	Organizational
Ni, Q. and Trombetta, A. and Bertino, E. and Lobo, J. 2007 [15]	Privacy
Masoumzadeh, A. and Joshi, J. 2008 [16]	Privacy
Zhao, Y. and Zhao, Y. and Lu, H. 2008 [17]	Resource
Bertino, E. and Catania, B. and Damiani, M.L. and Perlasca, P. 2005 [? ]	Spatial
Ray, I. and Kumar, M. and Yu, L. 2006 [18]	Spatial
Hansen, F. and Oleshchuk, V. 2003 [19]	Spatial
Aich, S. and Sural, S. and Majumdar, A. 2007 [20]	Spatio-Temporal
Chen, L. and Crampton, J. 2008 [21]	Spatio-Temporal
Samuel, A. and Ghafoor, A. and Bertino, E. 2007 [22]	Spatio-Temporal
Chandran, S. and Joshi, J. 2005 [23]	Spatio-Temporal
Ray, I. and Toahchoodee, M. 2007 [18] 6	Spatio-Temporal
Aich, S. and Mondal, S. and Sural, S. and Majumdar, A. 2009 [24]	Spatio-Temporal
Yao, L. and Kong, X. and Xu, Z. 2008 [25]	Task
ZHANG, S. and CHEN, X. and HOU, G. 2009 [26]	Task
Oh, S. and Park, S. 2003 [27]	Task
Joshi, J.R.D. and Bertino, E. and Latif, H. and Ghafoor, A. 2007 [28]	Temporal

Given that there were multiple papers for some categories, the researchers decided to tackle all further research questions by first analyzing the research question on a per category basis and then looking across all categories for generalization and trends.
